CERES Overview:
Clouds and the Earth's Radiant Energy System

## Bruce A. Wielicki
NASA Langley Research Center

CERES Data Products Workshop
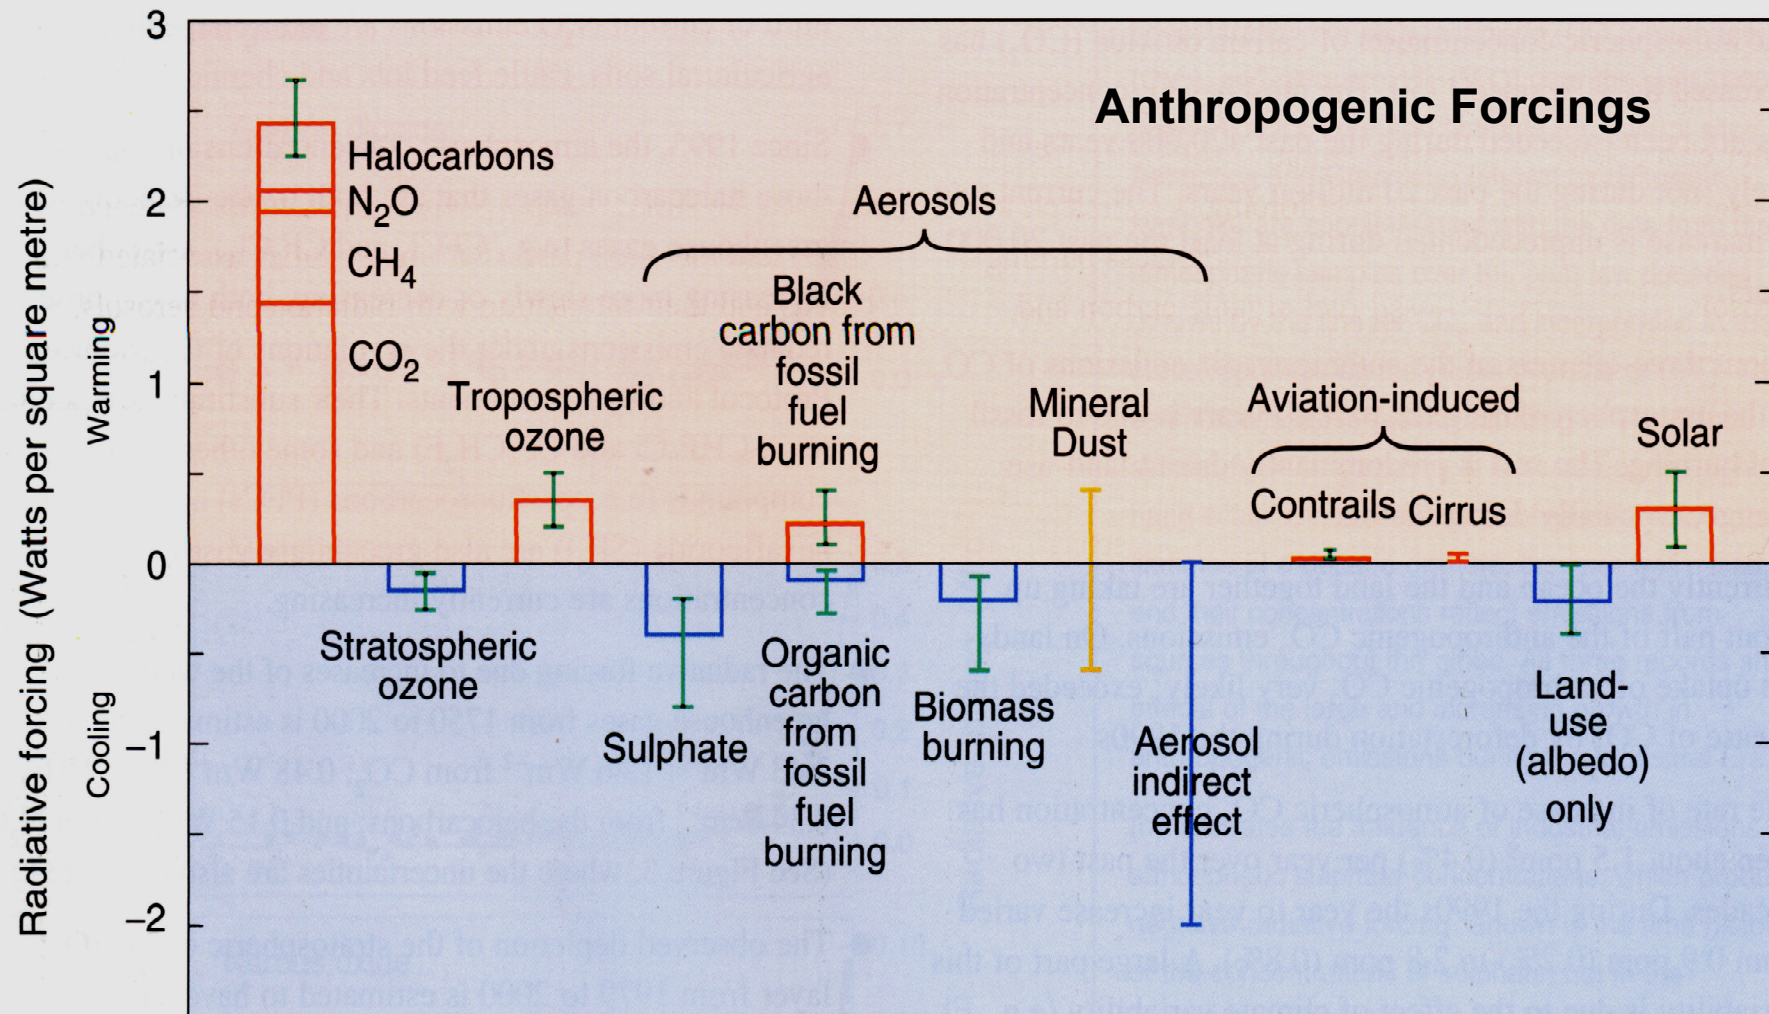

Norfolk, VA

January 29-30, 2003

Outline

- **Climate change background**

- **CERES introduction**

- **Advances of CERES over ERBE**

- **Data product examples**

- **Web site links**

- **Selected journal references**

- **Future directions**
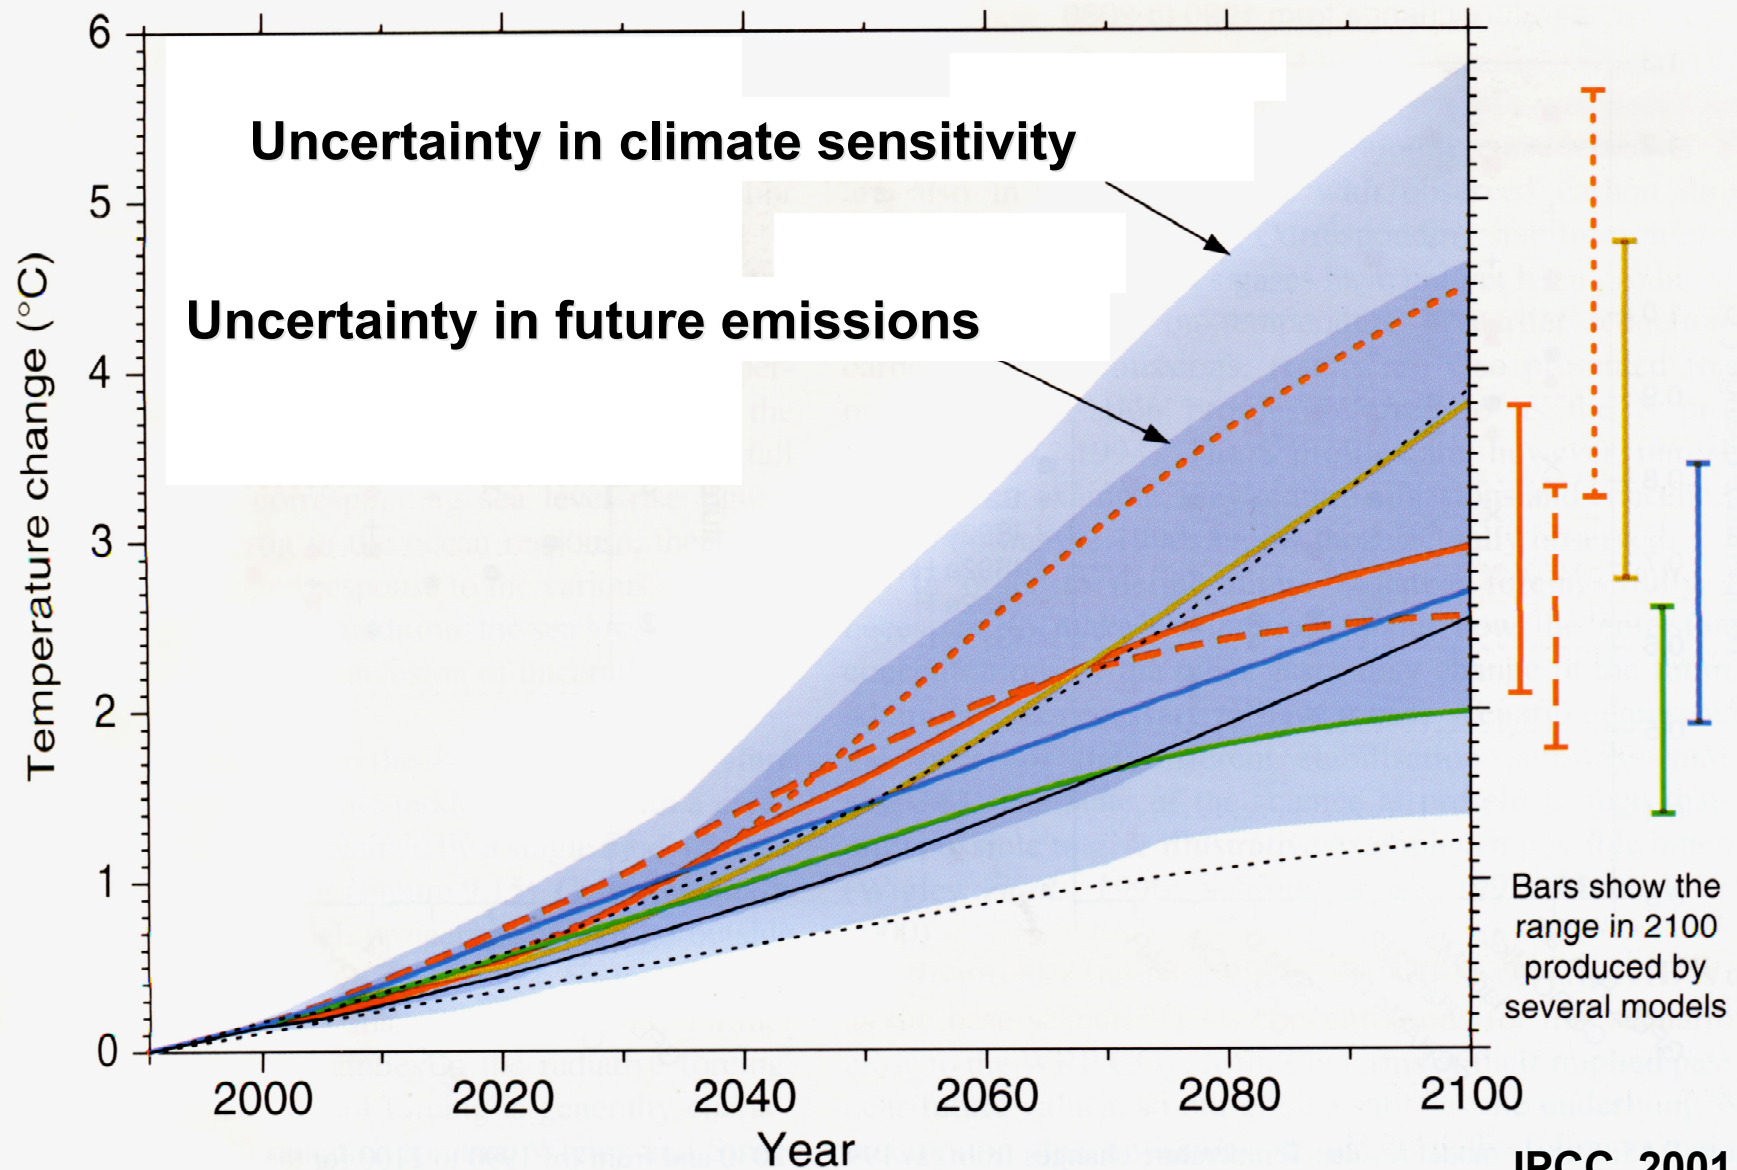

Human Influence on Climate

Carbon Dioxide Trends: 100yr lifetime

Methane Trends

Sulfate Trends

Global Temperature Trends

Radiative Forcing from 1750 to 2000

IPCC, 2001

Global Temperature Predictions

Uncertainty in climate sensitivity

Uncertainty in future emissions

Temperature change (°C)

Year

Bars show the range in 2100 produced by several models

IPCC, 2001

How does the Earth Respond?

Forces Acting On the Earth System

Earth System Response

IMPACTS
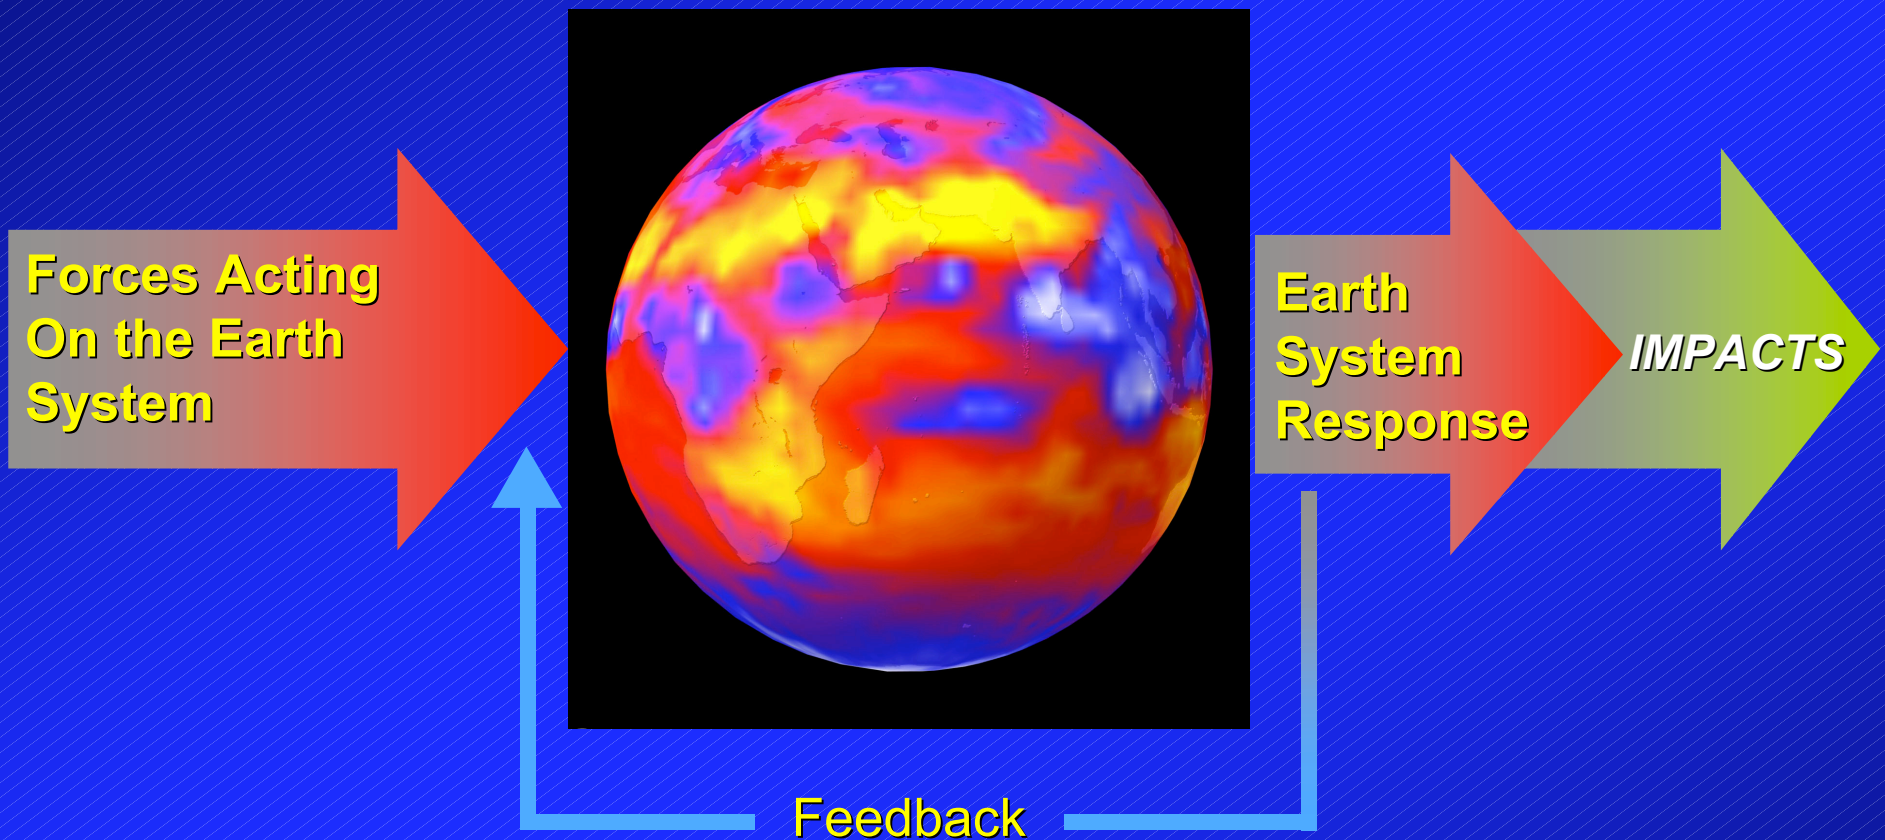

Feedback

**Feedbacks examples:**

Water vapor (positive), clouds (unknown), snow/ice albedo (positive)

Climate System Energy Balance

CERES Science Team

Bruce A. Wielicki, Principal Investigator

M. Viollier - CNRS
S. Dewitte - RMIB

R. D. Cess - SUNY/SB

J. A. Coakley - OSU

D. A. Randall - CSU

V. Ramanathan - Scripps

M. D. King - GSFC

A. J. Miller - NOAA/NWS

G. L. Smith - VPI&SU

R. M. Welch - UA/Huntsville

L. J. Donner - NOAA/GFDL

N. G. Loeb - HU

LaRC

B. A. Baum	R. B. Lee III
L. H. Chambers	P. Minnis
T. P. Charlock	K. J. Priestley
R. N. Green	T. Wong
D. P. Kratz	D. F. Young

CERES Instrument

TRMM:
Jan-Aug 98
and Mar-Apr 2000
overlap with Terra

Terra:
**Mar 00 - present**
planned life: 2006

Aqua:
July 02 start
Now in checkout
Planned life to 2008

NPOESS:
TBD: gap or overlap?
2008 to 2011 launch

CERES Data Processing Flow

CERES Data → *6 Months* → **CERES Calibration/Location** → *6 Months* → **ERBE Inversion** → *6 Months* → **ERBE Averaging** → *6 Months* → **ERBE-Like Products**

Cloud Imager Data → *18 Mo.* → **Cloud Identification; TOA/Surface Fluxes**

30 Mo. **Angular Distribution Models**

24 Mo.

Diurnal Models

Atmospheric Structure → *36 Mo.* → **Surface and Atmospheric Fluxes**

36 Mo. **CERES Surface Products**

Geostationary Data → *42 Mo.* → **Time/Space Averaging**

42 Mo. → **CERES Time Averaged Cloud/Radiation TOA, SFC, Atmos**

Algorithm Theoretical Basis Documents:
  http://asd-www.larc.nasa.gov/ATBD/ATBD.html
Validation Plans:
  http://asd-www.larc.nasa.gov/valid/valid.html

Matching CERES Fovs with Imager Cloud Properties
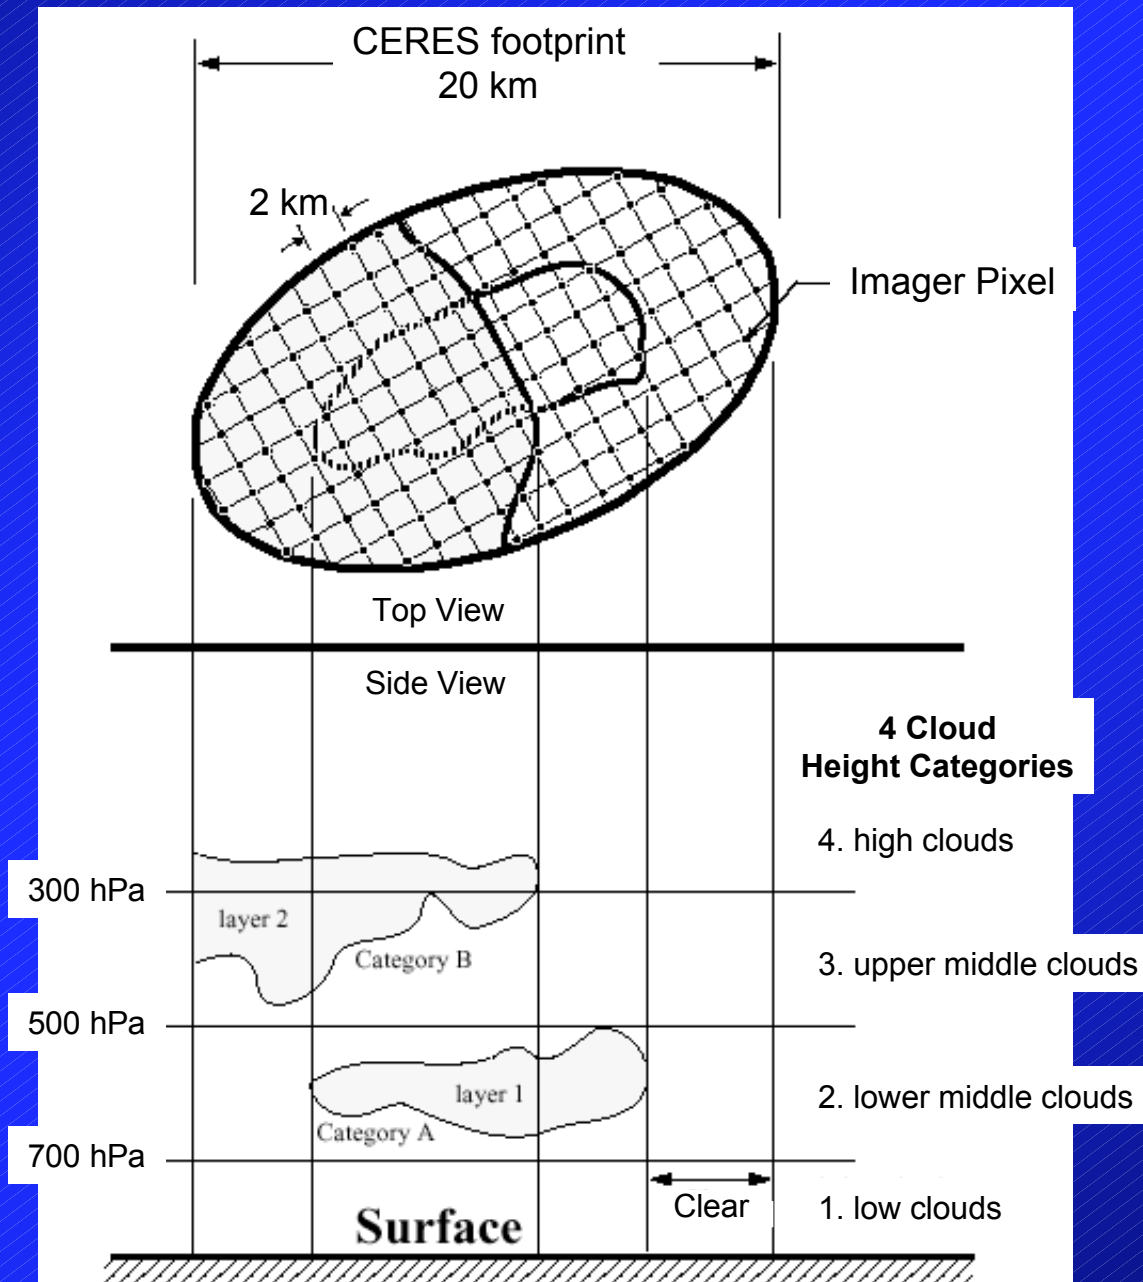

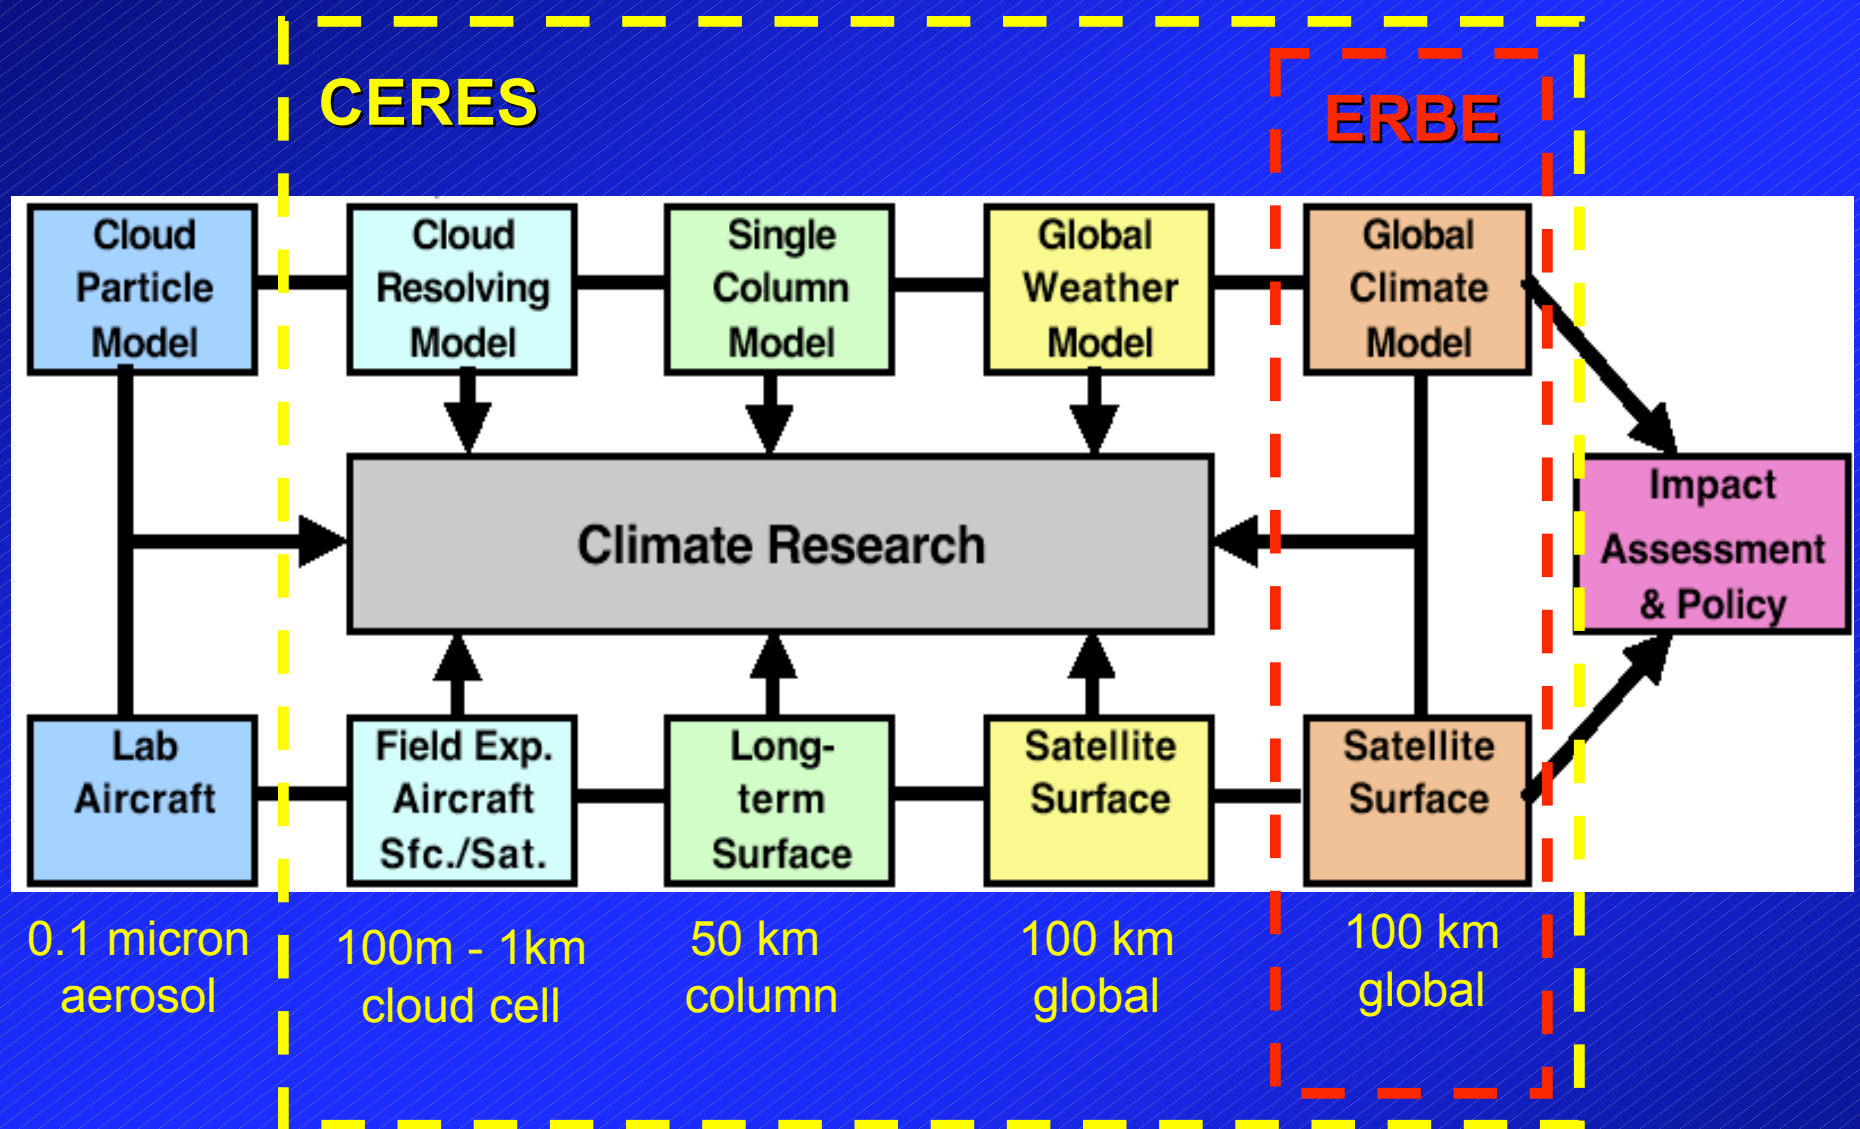

Range of Cloud/Aerosol/Radiation Model Tests

ERBE Error Analysis: CERES goals

- **Instantaneous TOA Flux error dominated by:**
  - Angle Sampling Error: (new adms: factor 2-3 reduction)

- **Monthly mean regional TOA flux errors dominated by: (CERES improvement)**
  - Absolute calibration (factor of 2 improvement)
  - Angle Sampling Error (new adms: factor 2-5 reduction)
  - Time Sampling Error (add geo: factor of 2-3 reduction)

- **Interannual/Decadal errors dominated by:**
  - Calibration stability (< 1 Wm^{-2}, goal 0.25 Wm^{-2})

What makes CERES unique?

- **Calibrate. Calibrate. Calibrate.**
    - *most accurate and stable of EOS radiometers.*
    - *climate is a 1% game: calibration before resolution.*

- **Sample. Sample. Sample.**
    - *Radiation is an 8-dimensional sampling problem:*
        $$x, y, z, t, \lambda, \Theta_o, \Theta, \Phi$$
    - *2 CERES scanners: one for x,y. One for Θ, Φ.*
    - *Imager for z, Θ, Φ (select ADMs. z later using lidar/radar).*
    - *TRMM precessing orbit: all Θ_o.*
    - *Geostationary and Terra/Aqua orbits for t*
    - *Data products integrate up to 11 instruments on 7 spacecraft.*
    - *500,000 lines of production code, another 500K offline.*

- **Validate. Validate. Validate.**
    - *Large ensembles of cases: ARM, BSRN, etc to reach 1%*
    - *Satellite checks using GERB (diurnal), Calipso/Cloudsat (z)*
    - *Few field experiment cases not enough: A/C > Sfc > Sat*
    - *Created data quality summaries for quick assessment*
    - *Beta to Validated (Edition) to involve community early*

CERES is Complex: Why does it work?
Failed IRS, FAA, Denver baggage code similar size

- Difficulty of software is a power law: not linear in lines of code.
- CERES is ~ 500K lines of production code, and 500K lines of offline qc/validation. Failed FAA system was similar, but over $1B spent before failed.
- ERBE earlier experience with 1/4 the difficulty was key.
- Most of the team has been together for 10 to 20 years: turnover for software "contracts" can be 30%/yr
- Team dedicated to a mission, not a profession: a science advantage.
- Team focused first on interface definitions (data products) between major components and then let individual working group chairs control their part. Analogous to the way the web works.
- Science team, Algorithm team, Data Management team, Data Center team work together well: most at LaRC so that science and data are closely tied.
- Cost to develop CERES only 70% of computer industry cost for similar size developments.

Examples of Results

Unprecedented Accuracy of new EOS Radiation Data

Emitted Thermal Flux Measured By CERES
Terra   March 2000

ES-8
ERBE-Like
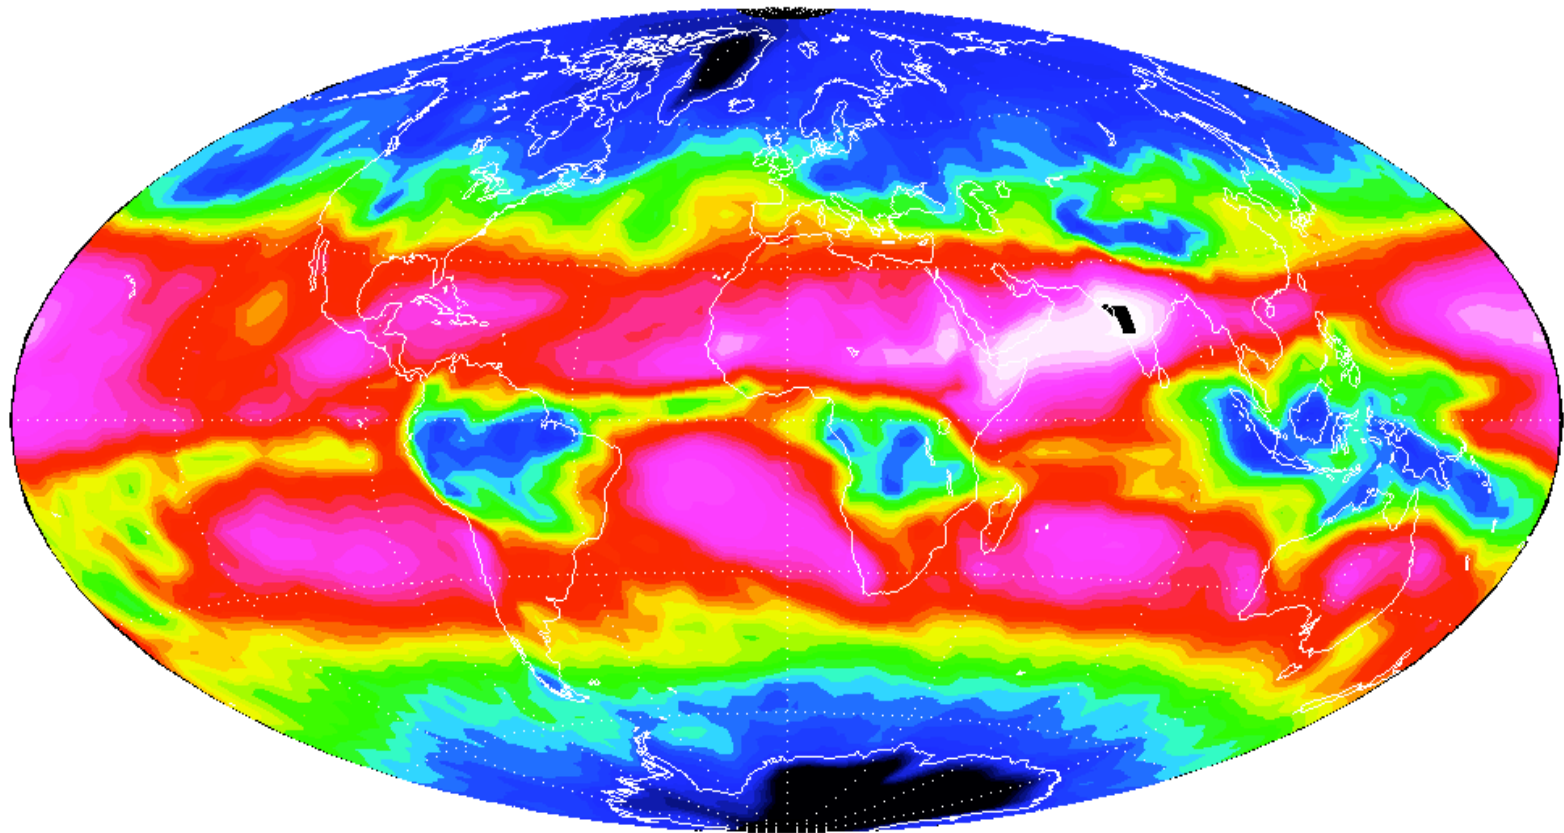

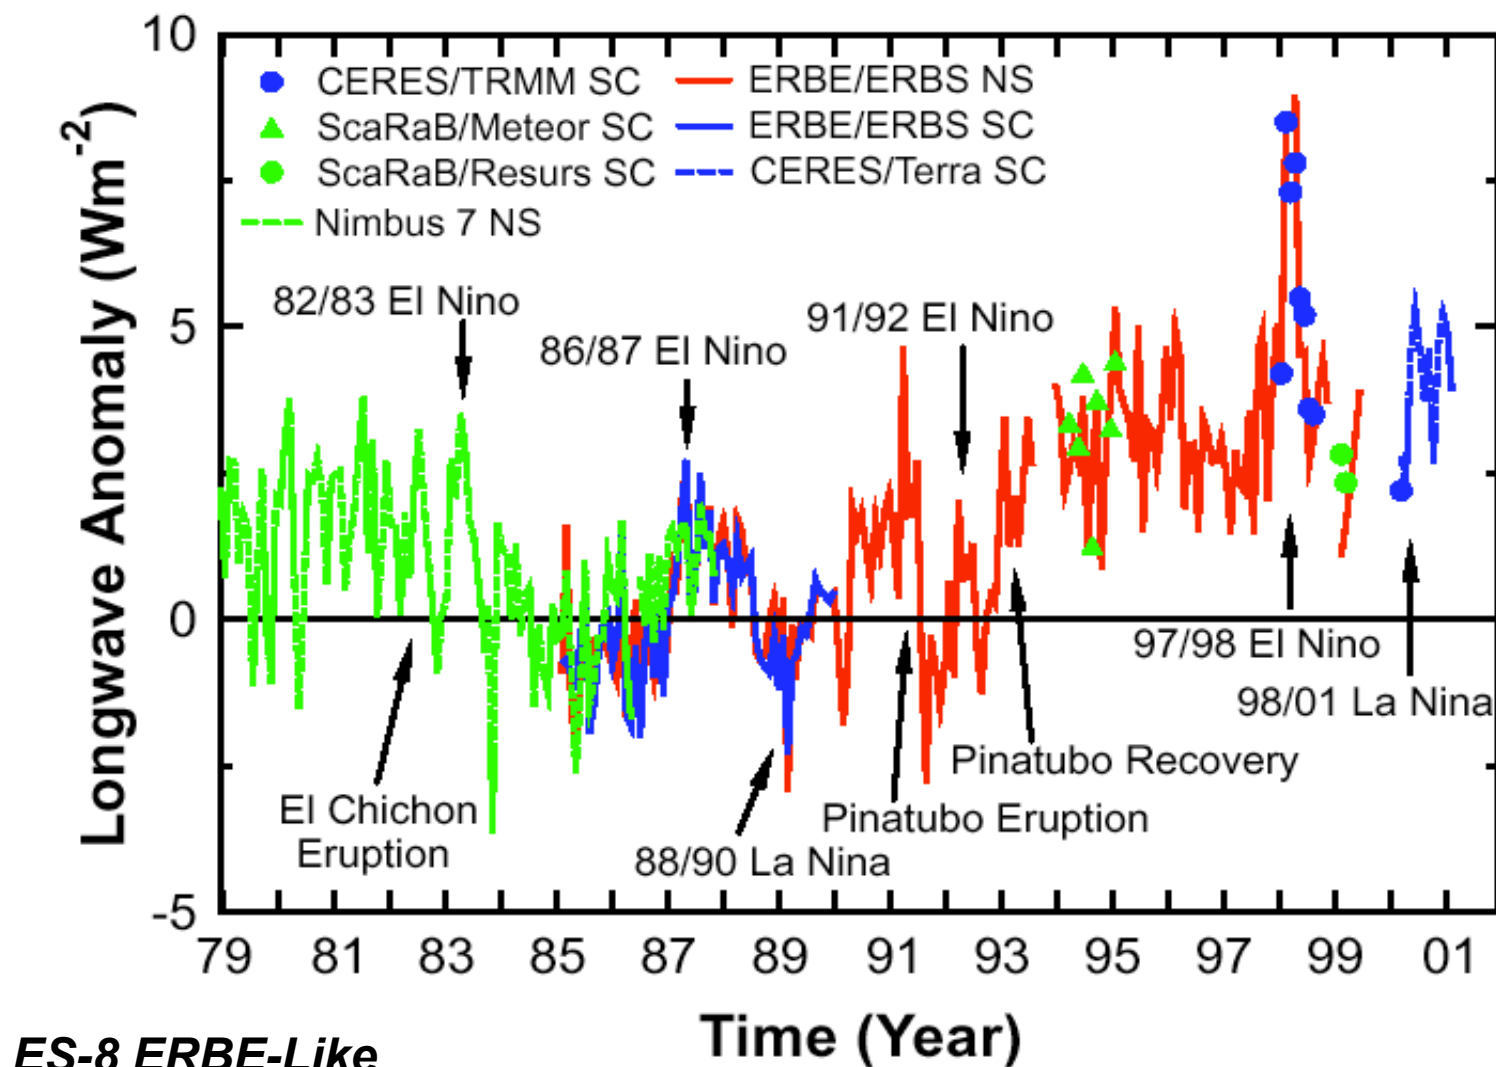

Watts per square meter

CERES Terra 14 day Running Average for TOA LW Flux
**March 2000 to May 2001**

Mar 2000

ES-8 ERBE-Like   **T. Wong, NASA LaRC and Data Visualization Group, NASA GSFC**

An overlapping Earth radiation climate record: 22 years from Nimbus 7 to Terra.

ES-8 ERBE-Like

Comparison of Observed Decadal Tropical Radiation Variation with Current Climate Models

LW: Emitted Thermal Fluxes

SW: Reflected Solar Fluxes
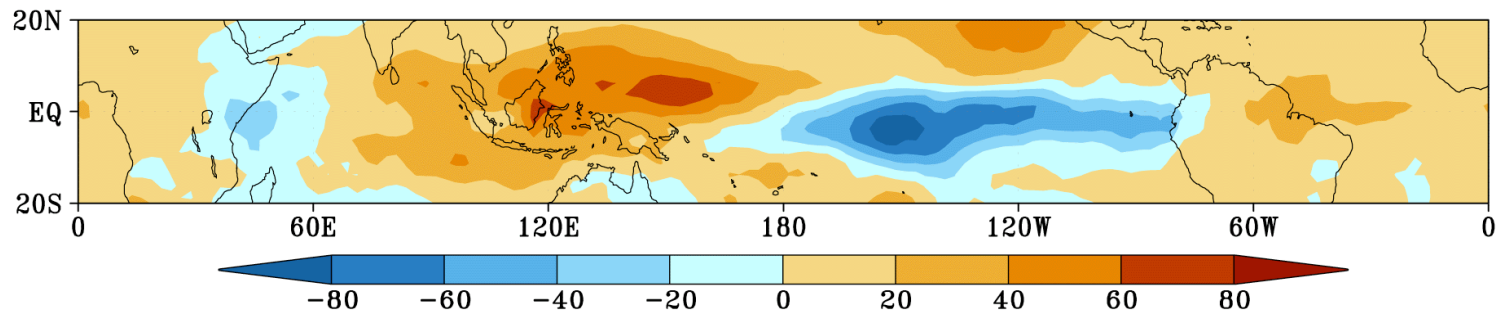

Net: Net Radiative Fluxes

Models less variable than the observations:
- *missing feedbacks?*
- *missing forcings?*
- *clouds physics?*

NASA EOS Data Directly Tests Policy Relevant Climate Sensitivity Hypotheses: The Iris

New EOS CERES fluxes accurate by cloud type allow direct testing of the Iris hypothesis: a simple climate model of strong negative cloud feedback:

Are the Iris assumed convective cloud radiative properties right?

Tropics   **Extratropics**

A_{cmoist} A_{dry} $A_{extropics}$

Cldy moist

Clr moist

Dry

$T_{st} = T_s + 10K$ $T_{set} = T_s - 10K$
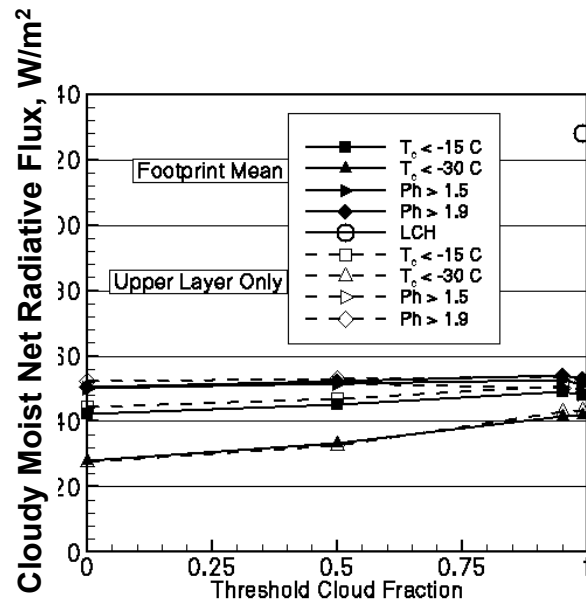

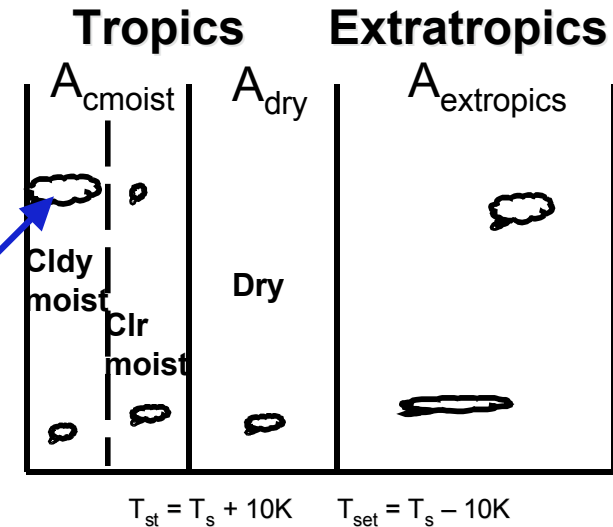

The Iris assumed cloud radiative fluxes

CERES observed cloud radiative fluxes: differ by 80-100 W/m^2 from the Iris, and rejects the Iris Hypothesis.

Cloudy Moist Net Radiative Flux, W/m^2

Footprint Mean

Upper Layer Only

- $T_c < -15$ C
- $T_c < -30$ C
- Ph > 1.5
- Ph > 1.9
- LCH
- $T_c < -15$ C
- $T_c < -30$ C
- Ph > 1.5
- Ph > 1.9

Threshold Cloud Fraction

L. Chambers

NASA's Surface meteorology and Solar Energy (SSE) Project and Beyond

Purpose: Provide NASA ESE data for the feasibility analysis and preliminary design of renewable energy power systems from small to large (Solar, Wind, Buildings, etc.).

Data Delivery Method: Easily accessible data tables and maps generated real-time for user at

http://eosweb.larc.nasa.gov/sse/

Users: Web site has 35,000 Hits/month, with 3,500 data downloads; the most accessed site at ASDC. Users include small to large companies, universities, government agencies, and banks.

Future: Teaming with NOAA, DOE/NREL, and Electric Power Research Institute to expand into forecasted data sets

P. Stackhouse

CERES by the Numbers

Publications (CERES team):	Journal	Conference
2002 (scaled SI index)	*40*	*40 at Rad Conf*
2001	*36*	*22*
2000	*39*	*40*
1999	*13*	*40*

Data Products Delivered:

8,000 Gbytes of data to date   4,000 Gbytes/yr currently

50 unique users per quarter   1/3 international (15 countries)

ES-8/4/9 ERBE-Like most popular early, then SSF dominates (TRMM).

Shipped 3.3 times the volume of all L2 and L3 validated products

Data Products Processed at Full Production:

Input Data: up to 11 instruments on 7 spacecraft:
   1,000 Gbytes/month, in 20,000 files

Output Data Products: 600 Gbytes/month, in 3,000 files
   75% in SSF and CRS Level 2 pixel products

Products range from 262GB/month(CRS L2) to 30MB/month (ES4 L3)

CERES continues as ERB on NPOESS in 2011
what about end of Aqua in 2008 to 2011? NPP?

Currently EOS to NPOESS transition has a 50% risk of a critical radiation data gap.

NASA is trying to resolve this with NPP mission plannd for launch in 2006 if funding allows.

NPOESS only plans to replace *after* failures....

Symptomatic of a climate observing system spread across agencies with different missions & priorities: climate is not #1 at any of them.

Radiation Budget Data Gap Probability

End of Year

What is an acceptable gap risk? 5%/decade? 10%/decade?

A climate observing system should have hot spares designed to assure overlap: not there yet.

CERES Data Processing Flow
