Twenty Fourth CERES-II Science Team Meeting

University of Washington

Seattle, Washington

September 1, 2015

Climate Science Branch, NASA Langley Research Center

Background (Part 1)

CERES uses several Surface-Only Flux Algorithms (SOFA) to compute SW and LW surface fluxes as well as the more precise model used by SARB. The SOFA algorithms include:

LPSA/LPLA:

Langley Parameterized SW/LW Algorithm

		Model A	Model B	Model C
SW	Clear	Li et al.	LPSA	--
	All-Sky	--	LPSA	--
LW	Clear	Inamdar and Ramanathan	LPLA	Zhou-Cess
	All-Sky	--	LPLA	Zhou-Cess

SOFA References:

 SW A: Li et al. (1993): *J. Climate*, **6**, 1764-1772.
 SW B: Darnell et al. (1992): *J. Geophys. Res.*, **97**, 15741-15760.
 SW B: Gupta et al. (2001): *NASA/TP-2001-211272*, 31 pp.

 SOFA: Gupta et al. (2010): *J. Appl. Meteor. Climatol.,* **49**, 1579-1589.
FLASH: Kratz et al. (2014): *J. Appl. Meteor. Climatol.*, **53**, 1059-1079.

Background (Part 2)

- The SOFA LW and SW Models are based on rapid, highly parameterized TOA-to-surface transfer algorithms to derive the surface fluxes.

- LW Models A and B and SW Model A were incorporated at the start of the CERES project.

- SW Model B was adapted for use in the CERES processing shortly before the launch of the CERES instrument on the TRMM satellite.

- The Edition 2B LW and SW surface flux results underwent extensive validation (Kratz et al. 2010).

- The ongoing validation process has already led to improvements to the LW models (Gupta et al., 2010).

- LW Model C (Zhou et al., 2007) was introduced into the Edition 4 processing to maintain two independent LW algorithms after a broadband LW Channel was chosen to replace the CERES Window Channel for the CERES FM-6 and the follow-on Radiation Budget Instrument (RBI).

- LW and SW Models B were incorporated into the FLASHFlux effort to produce a rapidly available Environmental Data Record (Kratz et al., 2014)
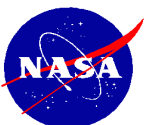

Recent and Future Improvements to the Surface-Only Flux Algorithms

SW Model Improvements: 1) Replacing the ERBE albedo maps with Terra maps greatly improved the SW retrievals, most notably for polar regions. **2)** Replacing the original WCP-55 aerosols properties with monthly MATCH/OPAC datasets while also replacing the original Rayleigh molecular scattering formulation with the Bodhaine et al. (1999) model significantly improved SW surface fluxes for clear conditions. **3)** To account for the short term aerosol variability we have incorporated daily MATCH aerosol data into Edition 4. **4)** Using a revised empirical coefficient in the cloud transmission formula has improved the SW surface fluxes for partly cloudy conditions. **5)** Work continues on the improvement of the cloud transmission method for the new Edition 4 clouds.

LW Model Improvements: 1) Constraining the lapse rate to 10K/100hPa (roughly the dry adiabatic lapse rate) improved the derivation of surface fluxes for conditions involving surface temperatures that greatly exceeded the overlying air temperatures, see Gupta et al. (2010). **2)** Limiting the inversion strength to -10K/100hPa for the downward flux retrievals provided the best results for cases involving surface temperatures that were much below the overlying air temperatures (strong inversions).

SW and LW Model Improvements: 1) The availability of ocean buoy measurements is expected to allow for improved surface flux retrievals by providing validation over ocean regions.

Parameterized models for fast computation of surface fluxes for both CERES and FLASHFlux

| Dataset	CERES 2B	CERES 4
Clear-Sky TOA albedo Terra	48 month ERBE	70 month Terra
Clear-Sky TOA albedo Aqua	46 month Terra	70 month Terra
Clear-Sky Surf. albedo	46 month Terra	70 month Terra
TOA to Surface albedo transfer	Instantaneous	Monthly average
Spec. Corr. Coef.	CERES 2B	CERES 4A
Cos (sza) dependence of Surface Flux	LPSA	Briegleb-type
Cloud Algorithm Terra	Terra Ed2	Terra/Aqua Ed4
Cloud Algorithm Aqua	Aqua Ed2	Terra/Aqua Ed4
SW aerosol dataset	WCP-55	MATCH/OPAC
Rayleigh Treatment	Original LPSA	Bodhaine et al (1999), JAOT.
Ozone Range Check	0 to 500 DU	0 to 800 DU
Twilight cutoff		New
Cloud transmission empirical coefficient	0.80	0.75
LW high temperature surface correction	No	Maximum Lapse Rate 10K/100hPa
LW Inversion correction	No	Maximum Inversion Strength -10K/100hPa

Status of Total Solar Irradiance (TSI) Measurements

The SORCE TIM (Total Irradiance Monitor) began producing TSI data on February 25, 2003; however, a battery failure on SORCE halted regular production from July 2013 through February 2014. As a result, we began incorporating the RMIB composite TSI data from S. DeWitte.

The RMIB data, however, requires an offset from the DIARAD VIRGO solar minimum value of ~1363 W/m^2 to match the SORCE solar minimum of ~1361 W/m^2. Note, for CERES Ed4 processing, all TSI data are offset to match the SORCE TSI Version 15.

In the meantime, the TSI Calibration Transfer Experiment (TCTE) was launched into orbit on November 19, 2013 and began producing TSI data on an irregular basis on December 16, 2013, and more recently, on a regular daily basis on January 1, 2015.

The SORCE instrument resumed data production on a daily basis on March 5, 2014. CERES subsequently resumed merging the SORCE TSI data into the CERES processing beginning on November 1, 2014.
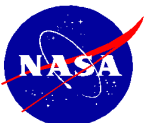

Comparison of TSI data [SORCE(V15) versus RMIB] for the 5-year overlap period 1-Mar-2003 to 29-Feb-2008

RMIB - SORCE V15 Offset -- 01Mar 2003 to 29 Feb 2008

Mean Offset = 2.4447
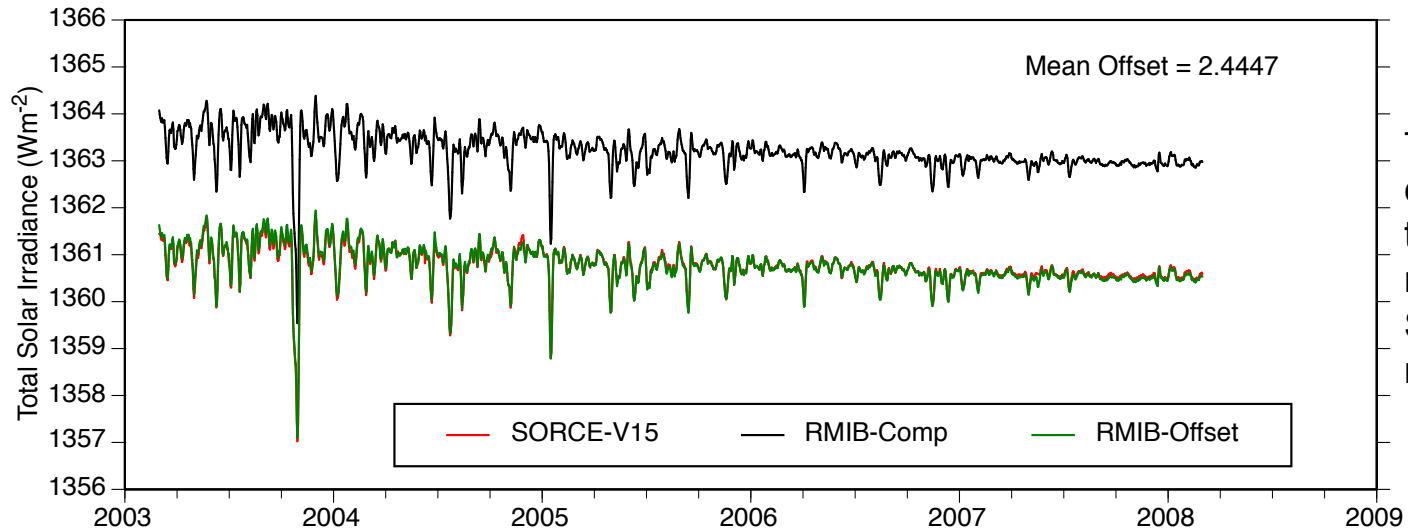

This timeframe corresponds to the first 60 months of the SORCE data record

Slope = -0.0237 Wm^{-2}/year
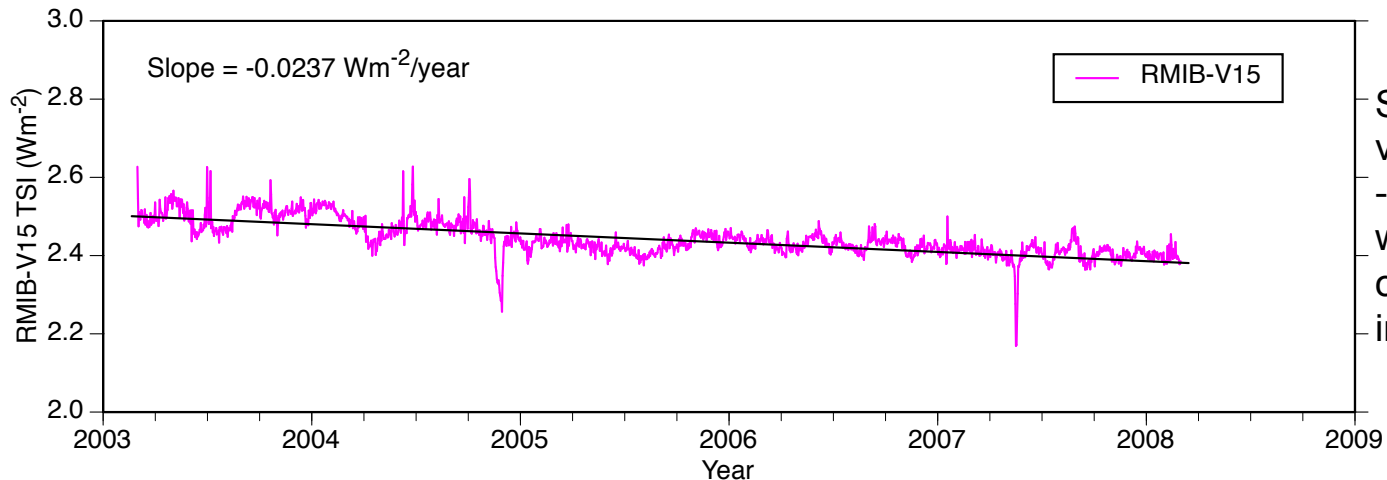

Slope of RMIB vs. SORCE is -0.0237 W/m^2/y which yields an offset of 1 W/m^2 in 42.19 years

Climate Science Branch, NASA Langley Research Center

TSI composite data from WRC, SORCE(V15) and RMIB for the Timeframe of CERES Terra, Aqua & NPP

Total Solar Irradiance for CERES Edition-4 (20000301-20150630)

WRC Composite — 01Mar2000 - 24Feb2003

SORCE (V15/V17) — 25Feb2003 - 30Jun2013
01Nov2014 - 30Jun2015

RMIB Composite — 01Jul2013 - 31Oct2014
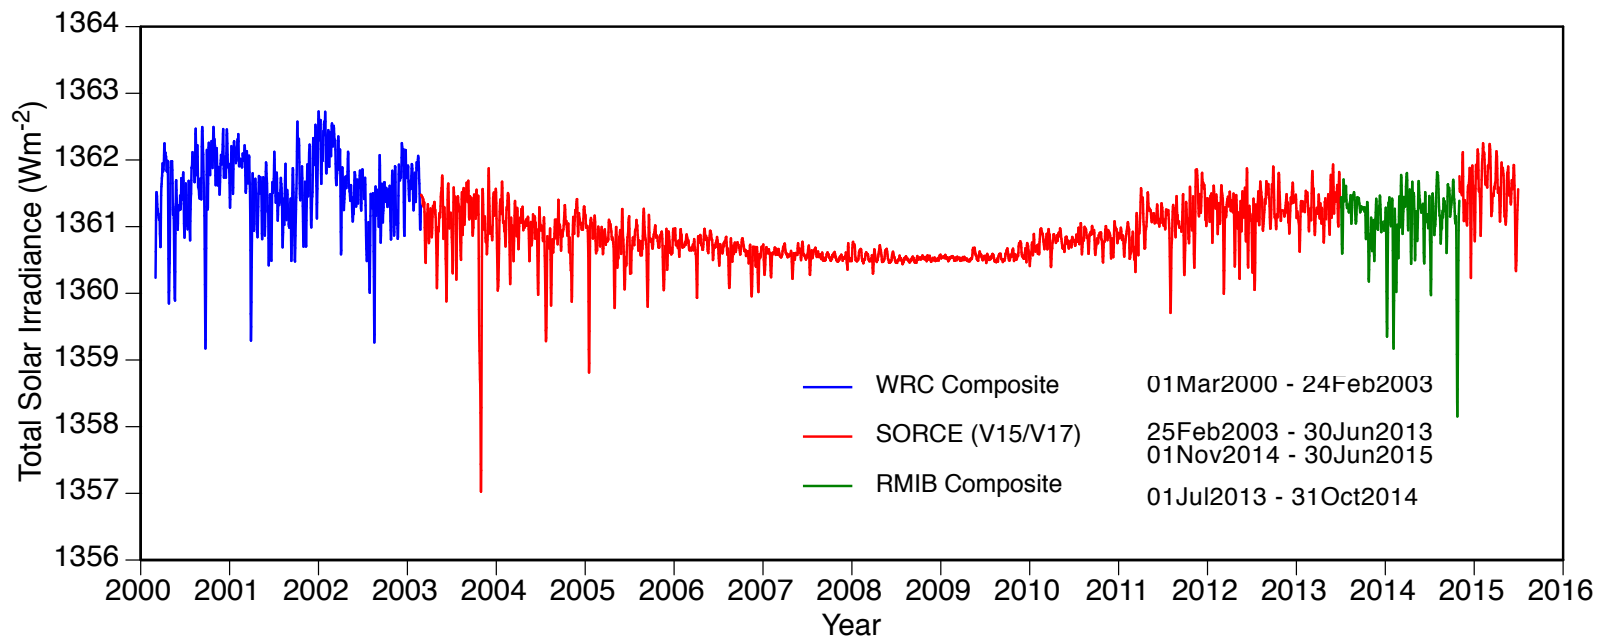

For CERES Ed4, all TSI data are offset to match SORCE TSI Version 15
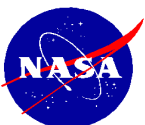

Climate Science Branch, NASA Langley Research Center

Comparison of SORCE(V15) and RMIB for the timeframe: 1-Mar-2003 to 23-Jun-2015

RMIB Offset vs.SORCE V15 -- 01 Mar 2003 to 23 Jun 2015
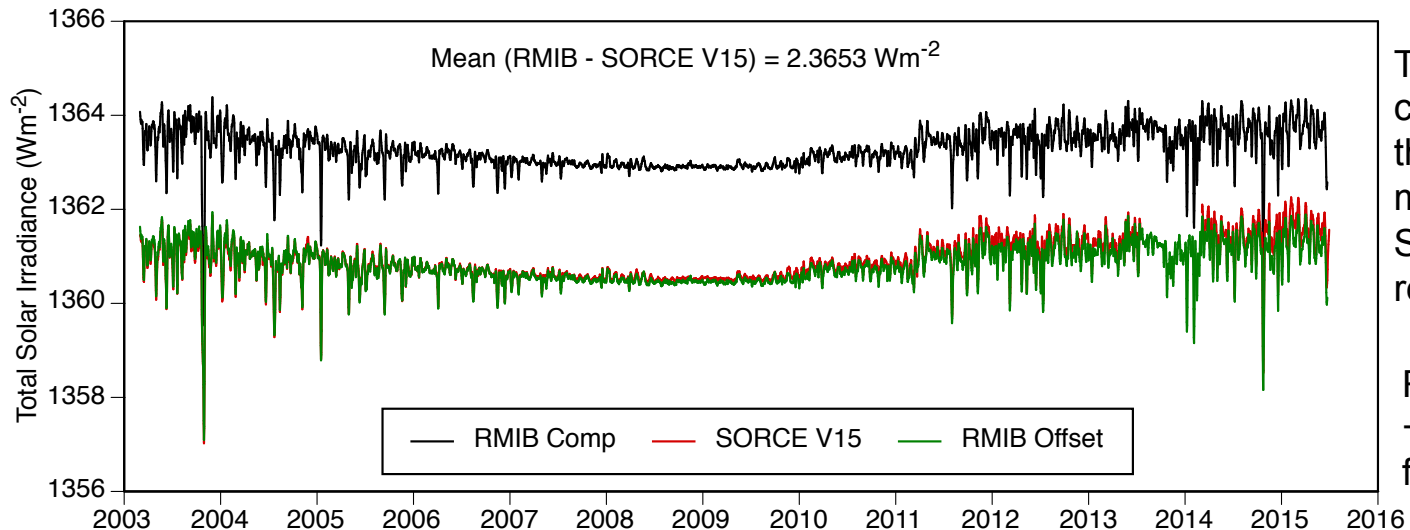

This timeframe corresponds to the first 148 months of the SORCE data record

RMIB offset by +2.3653 W/m^2 from SORCE
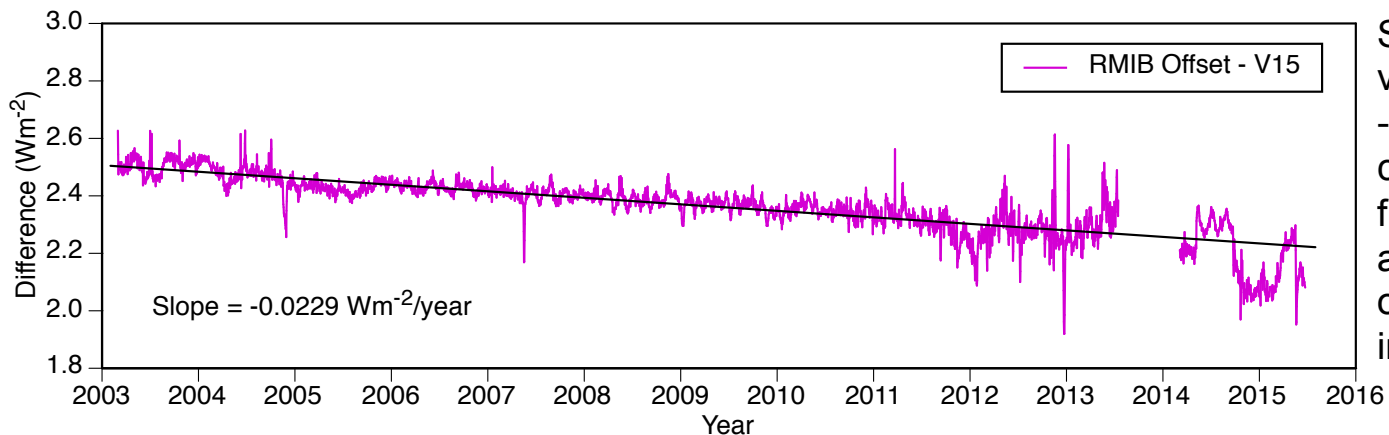

Slope of RMIB versus SORCE -0.0229 W/m^2/y corresponds to first 120 months and yields an offset of 1 W/m^2 in 43.67 years
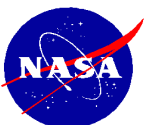

Climate Science Branch, NASA Langley Research Center

Comparison of RMIB Composite to Revised PMOD
for the timeframe: 1-Jan-2011 to 30-Jun-2015

RMIB Composite vs. PMOD Virgo TSI Comparison
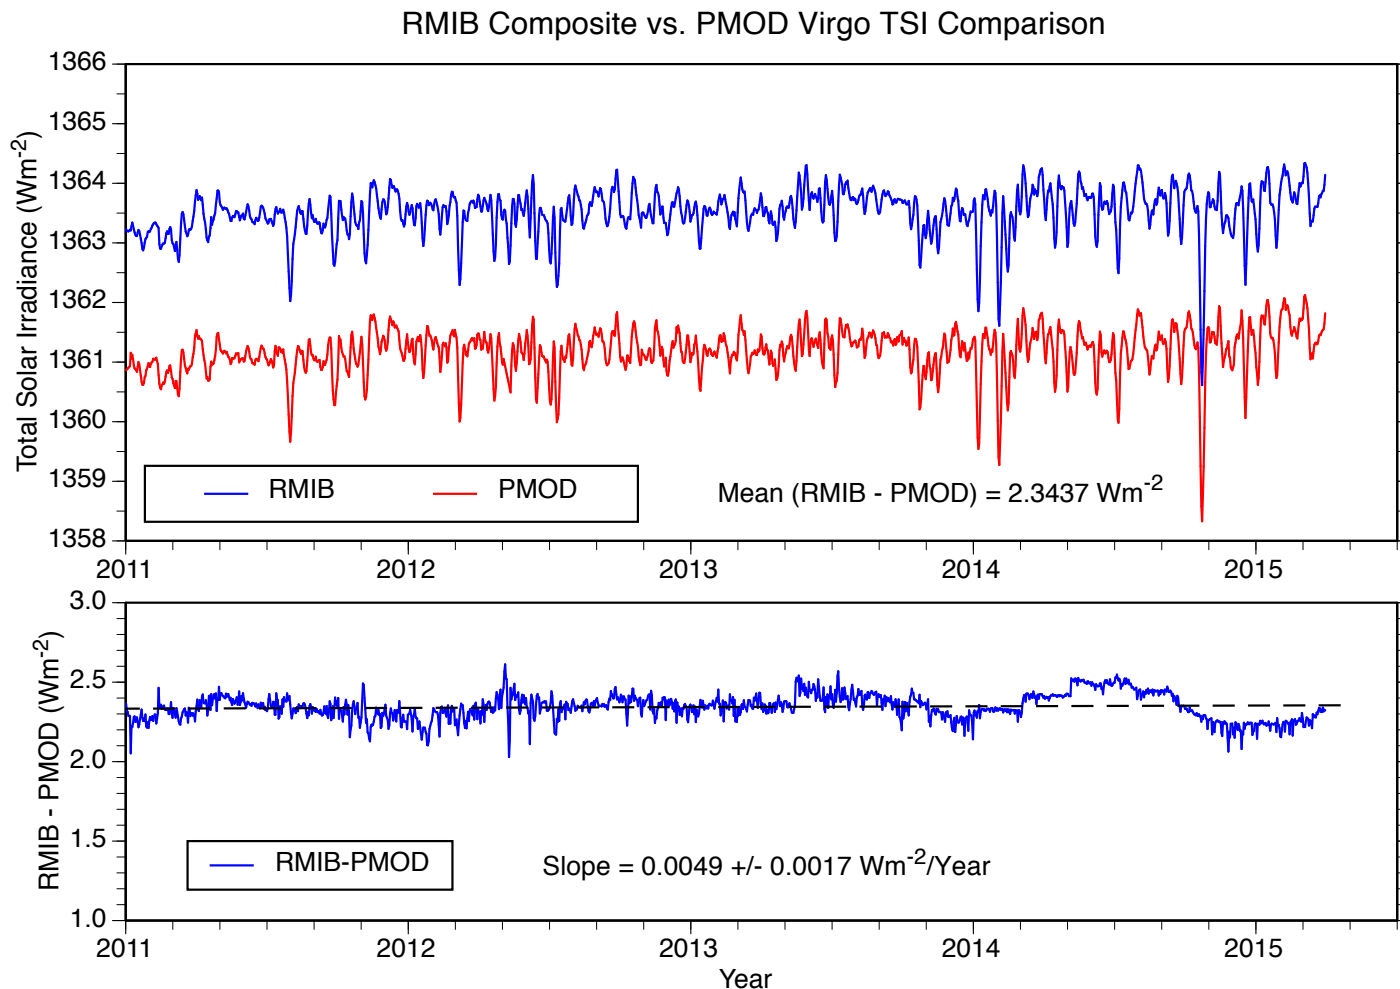

Revised PMOD values differ from RMIB by -2.3437 W/m^2

Slope of RMIB versus PMOD -0.0049 W/m^2/y corresponds to first 120 months and yields an offset of 1 W/m^2 in 204 years

Climate Science Branch, NASA Langley Research Center

Comparison of SORCE(V17) and TCTE(V02) Total Solar Irradiance Retrievals

TSI Comparison: SORCE V17 vs. TCTE V02 (16 Dec 2013 to 14 Aug 2015)
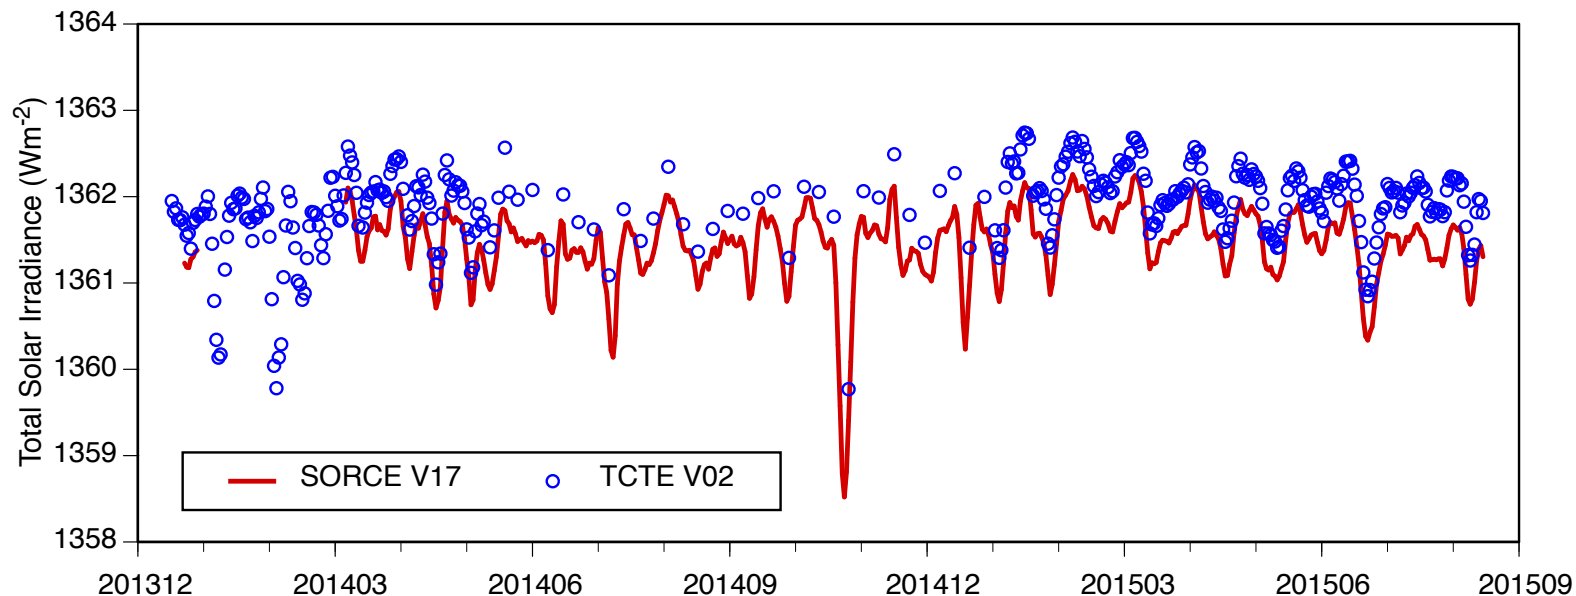

SORCE: 1 value/day, Dec 22, 2013 through Dec 28, 2013, and 1 value/day Mar 5, 2014 through Aug 31, 2014; Absolute Accuracy: ±0.48 W/m² at 1361 W/m²

TCTE: 1 value/day, Dec 16, 2013 through May 8, 2014, 1 value/week May 11, 2014 through Aug 31, 2014, 1 value/day Jan 1, 2015 through Aug 14, 2015; Absolute Accuracy: ±1.36 W/m² at 1361 W/m²

Average of SORCE minus TCTE (Jan 1, 2015 to Jul 31, 2015) is -0.4713 W/m²
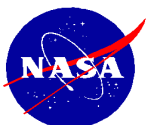

Climate Science Branch, NASA Langley Research Center

Inter-comparison of SORCE(V17), TCTE (V02) & RMIB Total Solar Irradiance Retrievals

SORCE V17, TCTE V02, and RMIB Comp. Offset to Match SORCE V15
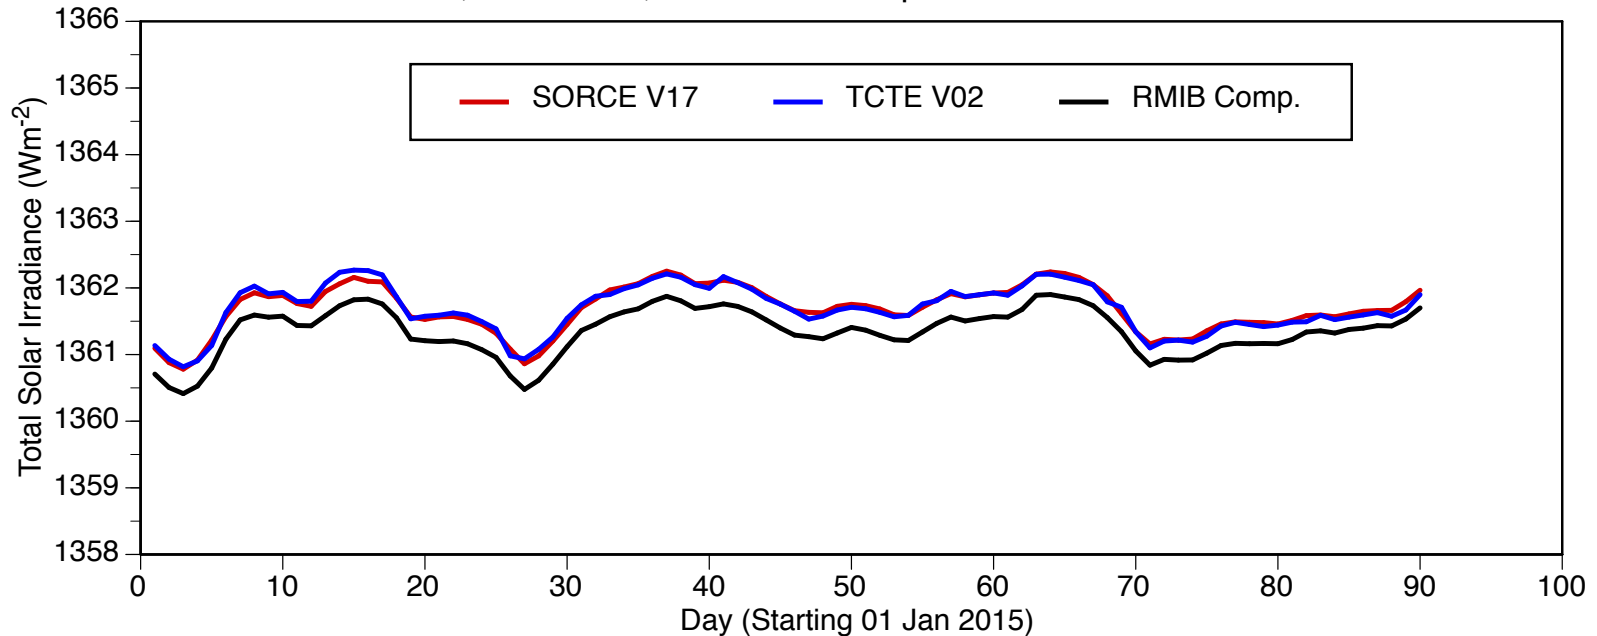

SORCE V17: 1 value/day, Jan 1, 2015 through Mar 31, 2015, Absolute Accuracy: 425 ppm or ±0.58 W/m^2 at 1361 W/m^2 (Abs. Accuracy was 350 ppm or ±0.48 W/m^2 before Oct 31, 2012) [Offset to SORCE V15 Mar 1, 2003 to Jun 30, 2013]

TCTE V02: 1 value/day, Jan 1, 2015 through Mar 31, 2015; Absolute Accuracy: 100 ppm or ±1.36 W/m^2 at 1361 W/m^2 [Offset to SORCE V15 1 Jan 2015 to Mar 31, 2015]

RMIB: 1 value/day, 1 Jan 2015 through 31 Mar 2015 [Offset to SORCE V15 Mar 1, 2003 to Jun 30, 2013]

SW TOA Difference W/m²

Time of Observation Difference
SW Surface Flux Results

The inter-comparison of the NPP and Aqua results for the SW demonstrated that the largest observed differences could be attributed to differences in the orbital parameters associated with the NPP and Aqua satellites. Differences in the orbits affect the time of observation, which affects the solar zenith angle, and consequently affects the measured value of the incoming TOA and surface SW fluxes.

Differences in the cloud effect play an important, though secondary role in producing the differences between the NPP and Aqua results.

LW Surface Flux Results

Differences in the clouds appear to play the dominant role in producing the observed differences between the NPP and Aqua LW fluxes for both Day and Night.

Conclusions for SOFA Ed4 algorithms

Previous validation studies have demonstrated that revisions to both the LW algorithms and the SW algorithms (for clear to partly cloudy conditions) appear to be working well, though further revisions to the cloud transmission method and/or overcast albedo method are needed for SW Model B. Current attention is focused on deriving a regression fit to the cloud transmission data.

An analysis of the LW and SW surface only flux algorithm results using the Edition 4 inputs, especially those from the Clouds Subsystem, has indicated improved accuracies for most locations.

The comparison of the NPP and Aqua flux retrievals shows the anticipated results.

Climate Science Branch, NASA Langley Research Center
