CERES DMT Overview

Algorithms

- Implementation
- Verification
- Validation assistance

$$Z = \sum_{i=0}^n (\Delta C_i / \sigma C_i)^2 + \sum_{j=1}^m (\Delta v_j / \sigma v_j)^2 + \sum_{k=1}^l (\Delta F_k / \sigma F_k)^2 \quad (3)$$

where on the r.h.s. the first term represents the cloud fraction adjustment, the second term represents the model variable adjustments, and the third term the flux component adjustments.

Equation (4) below restricts the solution such that the sum of the cloud fraction adjustments is zero. This prevents unrealistic solutions (i.e., sum of adjusted total fraction of cloud cover is not zero).

$$X = \sum_{i=0}^n \Delta C_i = 0 \quad (4)$$

Software

- Maintenance
- Configuration management
